With this booklet you can learn to recognise some of Nillumbik's mammals, birds, reptiles and frogs. There are over 300 species of native animals (fauna) in the Shire of Nillumbik.

This booklet has been divided into sections, making it easy for you to identify different species. Record sheets have been included so you can record when and where you have seen native animals.

Shire of Nillumbik Habitat Corridors

Our native animals are constantly on the move finding food, water, mates, breeding sites and new homes.

It's vital that areas of animal habitat are linked and/or of sufficient size. Habitat corridors are land and water connections and stepping stones that link areas of habitat. They enable animals to move through the landscape, for example from one area of bushland to another, to find the resources they need.

Brush-tailed Phascogales nest in around 30 different sites each year and depend on habitat corridors to forage over their home range, which is a significant 30-60 hectares in size for females and 100 hectares for males.

Another Nillumbik example is Swift Parrots which breed in Tasmania and migrate to Victoria and NSW in the winter. They need habitat stepping stones along the way which they might spend days, weeks or months at.

There are lots of opportunities for people to help build habitat corridors and stepping stones for our native animals - in gardens, school grounds and paddocks for example.

How to help our native animals?

Don't feed native animals. Feeding can lead to many health problems and wildlife can become dependent on human food.

Look out for wildlife on or near the road when driving, particularly at night. Most of the significant habitat corridors in the Shire are close to or cross over major roads. If you find an injured, orphaned or sick native animal on the roadside please contact a local wildlife shelter or call Help for Wildlife on 0477 555 611.

Provide food and homes for native animals on your property by:

- Planting and retaining native vegetation
- Retaining fallen timber and logs
- Controlling rabbits, foxes and deer
- Creating frog ponds or small wetlands
- Installing nest boxes for birds and bats
- Protect the native vegetation on your property in perpetuity by Placing a Trust for Native conservation covenant on the title of your property

Nillumbik Shire Council supports landholders to protect native animal habitats through the Land Management Incentive Program. Grants are available for environmental fencing, native revegetation and weed control. Support and advice is also available from:

- Landcare
- Land for Wildlife
- Melbourne Water

Protecting our Native Animals

Nillumbik's native animals are protected under state legislation, in particular the *Wildlife Act 1975* and *Flora and Fauna Guarantee Act 1988 (FFG Act)*, and federally under the *Environment Protection and Biodiversity Conservation Act 1999*.

Eastern Grey Kangaroo
Macropus giganteus

Under the *Wildlife Act 1975*, it is an **offence** to:

- Hunt, take or destroy wildlife or game without a licence.
- Possess, buy or sell parts of wildlife without a licence.
- Import into, and export wildlife out of Victoria without a permit.

The *FFG Act* protects threatened native animal species and conserves their habitat. Nillumbik has 63 animal species which are listed as threatened. These include the Powerful Owl, Brush-tailed Phascogale and the Swift Parrot.

Some animal species (in particular some migratory birds) found within the Shire may also be protected under international agreements. The Japan-Australia Migratory Bird Agreement (JAMBA) the Republic of Korea-Australia Migratory Bird Agreement (ROKAMBA) and the China- Australia Migratory Bird Agreement (CAMBA) list terrestrial, water and shorebird species which migrate between Australia and the respective countries. These agreements limit the circumstances under which migratory birds are taken or traded and protect and conserve the important habitats of these birds.

The Department of Environment, Land, Water and Planning is responsible for the management of native flora and fauna on public and private land and in terrestrial, marine, estuarine and freshwater environments. They can provide expert advice on conserving and managing species as well as regulating wildlife possession and trade and the taking of native plants and animals.

Status

- ☺ Not threatened or endangered
- ☹ Rare
- ☹ Threatened or endangered

Reptiles

Black Rock Skink
Egernia saxatilis intermedia
Status: 😊

A broad-headed, thick-bodied, rough-scaled lizard. The Black Rock Skink lives amongst rocky outcrops and in the hollows of fallen trees. This reptile forages around its shelter and feeds on insects and spiders. Grows up to 11.5 cm long (from snout to vent).

Blotched Blue-tongued Lizard
Tiliqua nigrolutea
Status: 😊

Large, thick-bodied, short-legged lizard with a distinct blue tongue. This lizard is active during the day and shelters at night amongst leaf litter and hollow logs. They eat insects, snails, wildflowers and native fruits. Grows up to 25 cm long (from snout to vent).

Eastern Brown Snake

Pseudonaja textilis

Status: 😊

Dangerous and highly venomous

A large, slender, brown snake up to two metres long and pale to dark brown. The Eastern Brown Snake can be seen during daylight hours in a variety of habitats including wet and dry bushland areas. This rapidly moving reptile feeds on small mammals and reptiles.

Tiger Snake

Notechis scutatus

Status: 😊

Dangerous and highly venomous

Thick-bodied and up to one metre long. Upper surface has dark brown and yellow brown bands, but can be variable in colour. Tiger Snakes live in a broad range of habitats and have a diet mainly consisting of frogs. They are active during the day, but nocturnal in the warmer months. They can be aggressive if disturbed.

Tree Goanna

Varanus varius

Status: 😞

A very large, narrow-snouted and long-tailed lizard, up to two metres long. Black in colour with distinct yellow markings (spots and stripes). The Tree Goanna is found in both forest and woodland communities. They forage for carrion and will also feed on insects, other reptiles, small mammals and nesting birds or eggs. They are mainly arboreal, sheltering in tree hollows and often nests in termite mounds. The Tree Goanna will climb trees to shelter.

Frogs

Photo: John Wardzynski

Peron's Tree Frog

Litoria peronii

Status: 😊

A medium-sized, grey to grey-brown frog, with bright yellow inner thighs and armpits. It has distinctive eyes with a pupil that is plus shaped. This frog is an excellent climber that hides under bark during the day and often calls from up in trees in the evening. Adults can be found long distances from water.

Photo: John Wardzynski

Pobblebonk/ Southern Bullfrog

Limnodynastes dumerilii

Status: 😊

A large, brown, burrowing frog with variable markings on the back. This frog has a distinct pale brown stripe from beneath the eye to the top of the front leg. This burrowing amphibian is found near permanent water in farm dams, streams and wetlands. The Pobblebonk feeds on flies, beetles, spiders, grasshoppers and moths.

Photo: Nick Clemann

Photo: John Wardzynski

Spotted Marsh Frog
Limnodynastes tasmaniensis
Status: 😊

A medium-sized frog with dark blotches on the back. It is predominantly brown to grey-brown in colour. The Spotted Marsh Frog lives in many different habitats and feeds on flies, beetles and spiders. This amphibian uses logs and stones on the water's edge for shelter, and breeds in grassy areas after rain.

Photo: Peter Robertson

Striped Marsh Frog
Limnodynastes peronii
Status: 😊

A medium-sized, brown frog with dark brown to black strips along the back. The Striped Marsh Frog is mostly found near permanent water including dams, wetlands, ponds and streams. This amphibian survives well in urban areas in small garden ponds and eats flies, beetles, spiders, grasshoppers and moths.

Wetlands and ponds are important habitat for frogs. They provide food, shelter and breeding habitat.

Mammals

Black Wallaby
Wallabia bicolor
Status: 😊

A medium-sized hopping marsupial with dark brown to black fur. This shy, solitary animal sleeps by day and moves out at night to browse on native shrubs, sedges and grasses. The Black Wallaby lives along densely vegetated waterways and gullies.

Bush Rat
Rattus fuscipes
Status: 😊

A medium-sized, grey-brown rodent with flecks of yellow-brown and black. It has a narrow, hairless tail that is shorter than its body. The habitat of the Bush Rat includes forested areas with ground-covers including shrubs, logs, rocks and ferns. This mammal sleeps by day and feeds on plants, fungi and insects at night.

Photo: Peter Robertson

Brush-tailed Phascogale
Phascogale tapoatafa
Status: ☹️

A small, sharp snouted, carnivorous marsupial with dark-grey fur on the body and a black brush-like tail. They live in large areas of bushland, feeds on insects, small birds and mammals and are totally dependent on tree hollows for survival. Population numbers have decreased significantly due to loss of habitat and predation by foxes and cats.

Common Brushtail Possum
Trichosurus vulpecula
Status: 😊

A medium sized, nocturnal marsupial with grey fur, a black bushy tail and a pale grey to white belly. At night, the Common Brushtail Possum can be seen climbing through trees feeding on fruits, blossoms and the leaves of eucalypts. This mammal is dependent on tree hollows and cavities for sleeping during the day.

Common Wombat
Vombatus ursinus
Status: 😊

A medium-sized stocky marsupial with bristly grey-brown fur. This solitary marsupial, when not sleeping in one of its burrows, can be seen grazing on grasses and sedges. The Common Wombat prefers to live in densely vegetated locations that have grassy areas nearby.

Photo: Julia Franco

Eastern Grey Kangaroo
Macropus giganteus
Status: 😊

A large, long-snouted hopping marsupial with grey to grey brown fur. The Eastern Grey Kangaroo sleeps under low vegetation for most of the day and then comes out to graze on grasses and shrubs in the evening. This marsupial usually moves with others amongst well-vegetated areas.

Photo: Peter Menkhorst

Feathertail Glider
Acrobates pygmaeus
Status: 😊

A very small, mouse-sized nocturnal, gliding marsupial. This glider has grey-brown fur with a white belly and a flat, featherlike tail. The Feathertail Glider is totally dependent on tree hollows in forested areas so it can sleep by day in a nest of leaves. This very small mammal glides and climbs during the night and feeds on insects and nectar.

Koala
Phascolarctos cinereus
Status: 😊

A medium-sized stocky marsupial with blue-grey to grey-brown fur and a white belly. This efficient climber feeds almost exclusively on eucalypts, particularly on Manna Gums, along waterways and bushland areas. The Koala dozes amongst the tree branches during the day and feeds at night.

Platypus
Ornithorhynchus anatinus
Status: 😊

A small, medium-sized monotreme with a leathery duck bill-like snout, broad flattened tail and webbed feet. With its water-repellent fur and webbed feet, this solitary mammal is well adapted to its watery habitat. The Platypus rests in a burrow during the day and feeds at dusk on invertebrates from the mud and water.

Photo: Peter Marsack

Short-beaked Echidna
Tachyglossus aculeatus

Status: 😊

A small, medium sized monotreme with distinctive strong, sharp spines. The Short-beaked Echidna sleeps most of the day and feeds at evening and dawn on termites in amongst the bush. This solitary mammal defends itself by rolling into a spiny ball and digging into the ground.

Sugar Glider
Petaurus breviceps

Status: 😊

A small, gliding marsupial with grey fur and a black stripe in between the eyes. This gliding mammal is totally dependent on tree hollows for a place to sleep during the day. The Sugar Glider feeds on sap and insects and likes to live amongst open forest with numerous species of wattle.

Photo: Lindy Lumsden

Water Rat/Rakali
Hydromys chrysogaster

Status: 😊

A large aquatic rodent with dark-grey to black fur and an orange-brown to white belly. The tail is black with a white tip and slightly shorter than the body. The Water Rat has partially webbed feet and water repellent fur. Always close to fresh water, this mammal sleeps at night in the banks of a waterway and feeds on fish, young birds and large insects at dusk.

Photo: Viridans Pty Ltd

White Striped Freetail Mastiff
Tadarida australis

Status: 😊

A medium sized, fleshy-nosed microbat with dark brown fur. The White Striped Freetail Mastiff bat has distinctive white stripes under the surface where the wings and body meet. They are often found or heard in urban areas, in a diverse range of habitats.

Photo: Lindy Lumsden/
Viridans Images

Birds

bushland

Photo: David Parkes

Australian Magpie *Gymnorhina tibicen* Status: 😊

The Australian Magpie is a distinctive large black and white bird that is closely related to the butcherbirds. This territorial bird builds its nest 5-20 metres above the ground and searches for insects in open areas during the day. Their carolling call at dawn and dusk is well known.

Brown Treecreeper *Climacteris picumnus* Status: 😊

A grey-brown bird up to 18cm long. This bird has a characteristic pale grey eyebrow stripe on its head. The Brown Treecreeper lives in dry open forest and depends on tree hollows to nest. This hopping bird spends a lot of its time foraging for food including insects, beetles, bugs, larvae and ants.

Crimson Rosella
Platyercus elegans
Status: 😊

A medium-sized parrot with red plumage and elegant blue tail. The Crimson Rosella lives amongst eucalypt forest and woodlands and needs hollows in tall trees to nest. This colourful bird feeds on seeds, nectar, grains from weeds, grasses and shrubs, and lerps.

Galah
Eolophus roseicapilla
Status: 😊

A medium cockatoo with grey wings and back, a pink body and pale pink forehead and crown. This strong fast flying bird lives amongst woodland and grassy areas and feeds on seeds that have dropped to the ground. The Galah depends on tree hollows for nesting to breed.

Eastern Yellow Robin
Eopsaltria australis
Status: 😊

A small, grey and yellow bird. This foraging bird lives in areas of dense shrubs and breeds in open woodland. The Eastern Yellow Robin feeds most of the day on spiders, bugs, flies, ants, wasps, moths and grasshoppers found on shrub leaves.

Photo: Natural Resources and Environment / McCann

Laughing Kookaburra
Dacelo novaeguineae
Status: 😊

A large kingfisher with a white head and breast and dark, grey-brown back with patches of blue. This territorial bird lives in eucalypt woodlands and open forests all year. The Laughing Kookaburra depends on large trees with hollows to breed and feeds on snakes, lizards, rodents and insects.

Photo: David Parkes

Pied Currawong
Strepera graculina

Status: 😊

A large black bird with a white bar on the upper wings and white on the rump. The Pied Currawong lives amongst tall forests most of the year and nests in the outer branches of eucalypts. This nomadic bird feeds on stick insects, lizards, snails, caterpillars, berries and small birds.

Photo: Natural Resources and Environment / McCann

Red Wattlebird
Anthochaera carunculata

Status: 😊

A brown and white streaked, middle sized bird, with red 'wattles' suspended below the cheeks. This nomadic bird lives in the trees and shrubs of eucalypt woodland and forest, and also in suburban gardens. The Red Wattlebird feeds on the pollen and nectar of flowering eucalypts, banksias and hakeas.

Swift Parrot
Lathamus discolor

Status: 😞

A small parrot with a long tail, green feathers, blue-green cheeks and crown with red on the forehead and chin. The Swift Parrot is an endangered species of national significance that migrates from Tasmania to the mainland annually. This colourful bird depends on tree hollows for breeding and feeds on lerps, insects and the pollen and nectar from eucalypt blossoms.

Photo: Mike Carter

Yellow-faced Honeyeater
Lichenostomus chrysops

Status: 😊

A grey-brown bird with a characteristic broad yellow stripe running below the eye. In autumn, this migrating bird leaves its forest breeding areas and then heads north for the winter. The Yellow-faced Honeyeater feeds on insects and nectar from the flowers of eucalypts and banksias.

Dusky Moorhen
Gallinula tenebrosa
Status: 😊

A black to dark brown bird with a red shield on its forehead and beak. This territorial bird lives amongst wetlands and waterways and roosts in the reeds, up to two metres above the water. The Dusky Moorhen feeds on land and aquatic matter as well as insects, fish, snails and worms.

Photo: Wendy Opie/
Viridans Images

Birds

waterways and wetland

Photo: Wendy Opie/
Viridans Images

Lewin's Rail
Lewinia pectoralis
Status: 😞

A dark brown bird with mottled black markings on its back, a grey face and chestnut head. This endangered species needs swampy dense vegetation to build its nest, made of grasses or rushes, on the banks of wetlands. The Lewin's Rail is a good swimmer and finds its dinner of snails, insects and crustaceans in cracks in the ground.

Photo: Mike Carter

Birds

waterways and wetland

Pacific Black Duck

Anas superciliosa

Status: 😊

A duck with brown feathers and secondary metallic green wings. Its head has a black crown and beige face. The Pacific Black Duck prefers deep freshwater wetlands and nests on the ground or in tree hollows, reeds or grasses. This common duck feeds on seeds, water insects, yabbies and shrimp.

Straw-necked Ibis

Threskiornis spinicollis

Status: 😊

A large black and white bird with a long curved beak and long legs. The Straw-necked Ibis is a resident of rush lined wetlands and depends on good inland habitat for breeding. These birds feed on grasshoppers, caterpillars, water insects, snails, frogs and snakes.

Photo: Viridans Pty Ltd

Photo: Julia Franco

Birds

nocturnal birds of prey

Barking Owl *Ninox connivens* Status: 😞

A medium sized dark brown owl with white spots on its wings, a strongly streaked breast and brilliant yellow eyes. The Barking Owl has a distinctive call, a 'wuh wuh' noise that sounds like a dog barking or a high pitched 'screaming woman' call. This owl prefers open woodland and requires hollows for nesting.

Black-shouldered Kite *Elanus axillaris* Status: 😊

A small bird of prey with grey feathers and a white head, breast and belly. It has black feathers on shoulders of upper wings. The Black-shouldered Kite is nomadic and can be found in woodland areas. This bird of prey feeds at dawn and dusk on reptiles, insects, rodents and amphibians by gliding above and then dropping down on its prey.

Pacific Barn Owl

Tyto javanica

Status: 😊

A pale grey owl with a white belly, breast and face. This owl has a characteristic heart shaped mask on the face. The Barn Owl lives in open woodland and grassy areas and roosts during the day. This nomadic owl uses tree hollows to breed and feeds on house mice, native rodents, small birds, lizards, beetles and moths.

Tawny Frogmouth

Podargus strigoides

Status: 😊

A nocturnal, grey bird with dark grey and white streaks. This camouflaged bird roosts during the day in eucalypt and acacia woodlands and is active at night. The Tawny Frogmouth dives and snatches its food including large insects, spiders, centipedes and millipedes.

Powerful Owl

Ninox strenua

Status: 😞

A large owl, predominantly brown with pale brown barring. It has a white breast and belly with dark V-shaped brown bars and large, orange eyes. The Powerful Owl is a large bird that prefers open woodlands. This owl feeds on possums and gliders and usually roosts in tall leafy trees.

Wedge-tailed Eagle

Aquila audax

Status: 😊

A large bird of prey, dark brown to black with irregular streaks of light brown. The Wedge-tailed Eagle lives in both forest and open country and is the largest bird of prey in Australia. This hunting bird swoops down to feed on rabbits, wallabies, small kangaroos and occasionally reptiles.
